RESEARCH OVERVIEW

My research focuses on improving our understanding of the **geospace environment**, the region of the near-Earth space environment influenced by the Earth's magnetic field. My research topics have a common theme of **electromagnetic wave interactions with plasmas** in geospace. My research group studies the physics of lightning and its impact on the geospace environment. We study meteors, the plasma surrounding a meteoroid as it enters the Earth's atmosphere, using radar and optical techniques to understand the meteoroid environment around Earth. We study the propagation of very low frequency (VLF) radio waves in the waveguide formed by the Earth and the lower ionosphere, through the ionosphere, and throughout the magnetosphere, together with the interaction between these waves and radiation belt electrons.

We approach these and other research topics through a combination of **instrument development and data collection, data analysis, and modeling**. We develop optical, radio, X-ray, and particle instruments for ground-based and space-based measurements. We analyze the data from these and other space-based instruments using advanced analytical and numerical tools, including machine learning and filtering techniques. We utilize a range of numerical modeling techniques, including Finite Difference, Finite Element, and Monte Carlo techniques.
